#### **A** WARNING

This service information is designed for experienced repair technicians only and is not designed for use by the general public. It does not contain warnings or cautions to advise non-technical individuals of potential dangers in attempting to service a product. Products powered by electricity should be serviced or repaired only by experienced professional technicians. Any attempt to service or repair the product or products dealt with in this service information by anyone else could result in serious injury or death.

When you note the serial number, write down all 11 digits. The serial number may be found on the bottom of the unit.

# FOR SERVICE TECHNICIANS

ICs and LSIs are vulnerable to static electricity.

When repairing, the following precautions will help prevent recurring malfunctions.

- 1. Cover plastic parts boxes with aluminum foil.
- 2. Ground the soldering irons.
- 3. Use a conductive mat on worktable.
- 4. Do not grasp IC or LSI pins with bare fingers.

# **CAUTION**

Danger of explosion if battery is incorrectly replaced.

Replace only with the same or equivalent type recommended by the manufacturer. Dispose of used batteries according to the manufacturer's Instructions.

# 1 BATTERY

## 1.1. Recharge

When the RECHARGE indicator flashes or the unit beeps intermittently, place the handset on the base unit for 15 hours.

## 1.2. Battery information

After your Panasonic battery is fully charged:

Operation	Approx. battery life
While in use (TALK)	Up to about 5 hours
While not in use (Stand-by)	Up to about 14 days

- The battery operating time may vary depending on usage conditions and ambient temperature.
- As preventative maintenance, clean the handset and the base unit charge contacts with a soft, dry cloth. Clean if the unit is subject to grease, dust or humidity. Otherwise the battery may not charge properly.
- If the battery is fully charged, you do not have to place the handset on the base unit until the RECHARGE indicator flashes. This will maximize the battery life.
- The battery cannot be overcharged.

# **2 BATTERY REPLACEMENT**

If the RECHARGE indicator flashes after being fully charged, replace the battery with a new Panasonic P-P301 (KX-A36A) battery. When repalcing the battery, programmed information may be erased. Reprogram if necessary.

Press the notch on the battery cover firmly and slide it as indicated by the arrow.

2 Replace the battery and close the cover.

- Insert the battery plug into the connector as shown in the picture.
- Be sure wires are free from being pressed by the battery body or the handset cover.
- Make sure to charge the new battery for about 15 hours.

# **3 LOCATION OF CONTROLS**

## 3.1. Base Unit

## 3.2. Handset

# 4 CONNECTION

USE ONLY WITH Panasonic AC ADAPTOR PQLV16CEZ.

The AC adaptor must remain connected at all times.

(It is normal for the adaptor to feel warm during use.)

When more than one unit is used, the units may interfere with each other. To prevent or reduce interference, please leave ample space between the base units.

Install the battery in the handset, and close the handset cover, locking it into place.

Charge the battery for about 15 hours.

• The IN USE/CHARGE indicator lights.

# To select the dialing mode PULSE (preset) or TONE

If you have touch tone service, set to TONE. If rotary or pulse service is used, set to PULSE. Your phone comes from the factory set to PULSE. The TALK indicator light must be off before programming.

(tt) twice (PULSE)

Press [PROGRAMI 1AUTO] OR

^[PROGRA"M1.

0 twice (TONE)

- A beep sounds.
- •To cancel during programming, press [PROGRAM], then restart from the beginning.
- If 3 beeps sound during programming, a wrong key was pressed. Start again from the beginning.

# 4.1. Adding Another Phone

This unit will not function during a power failue. To connect a standard telephone on the same line, use a telephone T-adaptor.

## **5 OPERATIONS**

## 5.1. Making Calls

- Press (TALK).
  - The TALK indicator lights.
- **9** Dial a phone number.
- To hang up, press TALK or place the handset on the base unit.
  - The indicator light goes out.

# To redial the last number dialed on the handset

Press TALK → REDIAL .

# To select the handset receiver volume

3 levels (HIGH, MEDIUM, LOW) are available. Press LOUD while talking.

- Each time you press the button, the volume level will change.
- When you replace the battery, the selected receiver volume setting will return to the factory set (MEDIUM). Reprogram if necessary.

# If noise interferes with the conversation

Press **CH** to select a clearer channel or move closer to the base unit.

#### Backlit handset keypad

The handset dialing buttons will light when you press a button or lift the handset off the base unit, or when a call is received. The lights will go out a few seconds after pressing a button, lifting the handset or answering a call.

## 5.2. Answering Calls

If the handset is off the base unit, press **TALK**.

 You can also answer a call by pressing any dialing button ① to ⑨, ※ or # (—Any Key Talk).

## **OR**

If on the base unit, just lift up.

## Selecting the ringer volume

The TALK indicator light must be off.

• To select HIGH (preset) or LOW, press RINGER.

Each time you press the button, the ringer volume will change and the selected volume will ring.

- To turn the ringer OFF, press and hold RINGER until a beep sounds.
- To turn the ringer ON, press (RINGER).

## 5.3. Storing Phone Numbers in Memory

You can store up to 10 phone numbers in the handset. The dialing buttons (0) to (9) function as memory stations.

The TALK indicator light must be off before programming.

- ← Press (PROGRAM).
  - The TALK indicator flashes.
- 2 Enter a phone number up to 16 digits.
- Press AUTO.
- Press a memory station number (0 to 9).
  - A beep sounds.
  - To store other numbers, repeat steps 1 through 4.
- To cancel during programming, press PROGRAM. Start from step 1.
- If a pause is required for dialing, press
   PAUSE where needed. Pressing
   PAUSE counts as one digit.

## To erase a stored number

- Press (PROGRAM) → (AUTO) →
- the memory station number (0 to 9) for the phone number to be erased.
- A beep sounds.

## 5.4. Storing a Phone Number in the DIRECT Button

A phone number stored in the **DIRECT** button can be dialed with a one-touch operation.

The TALK indicator light must be off before programming.

- Press (PROGRAM).
  - The TALK indicator flashes.
- 2 Enter a phone number up to 16 digits.
- Press DIRECT.

   A beep sounds.
- To cancel during programming, press **PROGRAM**. Start from step 1.
- If a pause is required for dialing, press
   PAUSE where needed. Pressing
   PAUSE counts as one digit.

## To erase a stored number

Press **PROGRAM → DIRECT**.

• A beep sounds.

#### **Dialing a Stored Number** 5.5.

- Press (TALK).
  - The TALK indicator lights.
- Press (AUTO).
- Press the memory station number (O to 9).
  - The stored number is dialed.

#### Dialing a Stored Number in the DIRECT Button 5.6.

- Press (TALK).
  - The TALK indicator lights.
- Press Lines.

  The stored number is dialed. Press DIRECT.

#### **FLASH Button** 5.7.

Pressing FLASH allows you to use special features of your host PBX such as transferring an extension call or accessing special telephone services (optional), such as call waiting.

#### Selecting the flash time

The flash time depends on your telephone exchange or host PBX. You can select the following flash times; "90, 100, 110, 250, 300, 400, 600 or 700 msec (milliseconds)". Your phone comes from the factory set to "700 msec".

The TALK indicator light must be off before programming.

- · A beep sounds.
- If 3 beeps sound after programming, a wrong key was pressed. Start again from the beginning.
  If you are connected via a PBX, a longer flash time may be necessary to use PBX functions (transferring a call etc.). Consult your PBX supplier for the correct setting.

# **8 ADJUSTMENTS (BASE UNIT)**

If your unit have below symptoms, adjust or confirm each item using remedy column from the table.

Symptom	Remedy*
The base unit dose not respond to a call from handset.	Make adjustments in item (A)
The base unit dose not transmit or the transmit frequency is off.	Make adjustments in item (B)
The transmit frequency is off.	Make confirmation in item (C)
The transmit power outlet is low, and the operating distance between the base unit and the handset is less than normal.	Make confirmation in item (D)
The reception sensitivity of base unit is low with noise.	Make confirmation in item (E)
The transmit level is high or low.	Make confirmation in item (F)
The reception level is high or low.	Make adjustments in item (G)
The unit does not link.	Make confirmation in item (H)

<sup>\*:</sup> Refer to Adjustment (P.24).

## 8.1. Test Mode Flow Chart (Base Unit)

The operation-flow of Test mode and main check items are shown below.

#### Note:

<sup>\*\*:</sup> Refer to the above table.

## 8.2. How to change the channel

When short R98\* shortly, the channel will be changed as follows;

t\_\_\_\_\_

\*: Refer to Flow Solder Side View (P.66).

# 8.3. Adjustment

	Adjustment Items	Test Mode	Adjustment Point	'Procedure	Check or Replace Parts
(A)	RX VCO Confirmation	3ch Talk	-	• Confirm so that the reading of the Digital Voltmeter is 1.5V $\pm$ 0.5V.	IC1, L10, C26
(B)	TX VCO Adjustment	3ch Talk	Т6	• Adjust T6 so that the reading of the Digital Voltmeter is 2.0V $\pm$ 0.1V.	IC1, DV1, T6
(C)	TX Frequency Adjustment	3ch Talk	VC1	<ul> <li>Adjust VC1 so that the reading of the frequency counter is 30.175MHz ± 0.1 KHz.</li> </ul>	IC1, X1, T6, DV1, C35, C40, VC1
(D)	TX Power Adjustment	3ch Talk	T5	Adjust T5 so that the reading of the RF VTVM is over 10dBm.	IC1, Q3, Q4, Q5, T5, DPX1
(E)	RX Sensitivity Adjustment (2nd IF output)	3ch Talk	T2	1. Apply -60dBm output from S.S.G. (modulation frequency 1 KHz, dev. 0KHz).      2. Adjust T2 so that the reading of RF VTVM is the maximum value (more than 20mV)	DPX1, T2, CF1, CF2
(F)	Line Output Level Confirmation	3ch Talk		1. Apply -60dBm output from S.S.G. (modulation frequency 1 KHz, dev. 3 KHz).      2. Confirm that the reading of AF VTVM is 80mV ± 20mV (600W load).	IC1, Q11
(G)	Line Input Modulation Confirmation	3ch Talk		I. Input via loop simulator 1.0KHz, 80mV (measured at T-R) signal.     Apply -60dBm output from S.S.G. (modulation frequency 1 KHz, dev. 0KHz).     Confirm so that the reading of FM Deviation Meter is 2.8KHz ± 0.3KHz.	IC1, DV1
(H)	Noise Squelch Confirmation	3ch Talk		Measure the SSG output level when the noise squelch changes from Low to High.     Confirm so that the SSG output level is -105dBm ~ -110dBm.	IC1, DPX1

 $<sup>^{\</sup>star}$ : The connection of adjustment equipment are as shown in **Adjustment Standard (Base Unit)** (P.25). SSG Frequency: 39.875 MHz

en N

Note: (A) - (H) is referred to ADJUSTMENTS (BASE UNIT) (P.23)

# 9 ADJUSTMENTS (HANDSET)

If your unit have below symptoms, adjust or confirm each item using remedy column from the table.

Symptom	Remedy*
The movement of Battery Low Indicator is wrong.	Make confirmation in item (A)
The base unit does not respond to a call from the handset.	Make adjustments in item (B)
The base unit does not transmit or the transmit frequency is off.	Make adjustments in item (C)
The transmit frequency is off.	Make confirmation in item (D)
The transmit power outlet is low, and the operating distance between the base unit and the handset is less than normal.	Make confirmation in item (E)
The reception sensitivity of base unit is low with noise.	Make confirmation item (F)
Does not link between the base unit and the handset.	Make confirmation in item (G)
The reception level is high or low.	Make confirmation item (H)
The transmit level is high or low.	Make adjustments in item (I)

<sup>\*:</sup> Refer to Adjustment (P.27).

#### Unit condition:

- 1. Remove the antenna lead wire from P.C Board of the handset.
- 2. Power Supply: DC 3.9V (DC power supply)
- 3. Volume: HIGH (When P.C. Board of handset is in test mode, volume condition is medium. Press "LOCATOR" key once.)
- 4. Speaker Load: 150W

# 13 EXPLANATION OF CPU DATA COMMUNICATION

## 13.1. STAND-BY -> TALK, TALK -> STAND-BY

## Press the TALK button

- ① The handset transmits TALK\_ACK.
- ② Then base unit transmits ACK\_OK including the channel number (Example: "3").
- ③ The handset transmits TALK\_CMD.
- 4 The base unit goes to off-Hook mode.

## Press the TALK button

- ⑤ The handset transmits STANDBY\_CMD at the channel.
- The base unit transmits CONDITION at the TALK channel.

The channel is changed if the noise interferes with the conversation.

# 13.2. Ringing

- When the bell signal is input, the base unit transmits BELL.
   The handset rings the bell on receiving BELL.

## 13.3. Changing the Channel

Press the CH button.

- ① The handset transmits CHANNEL\_ACK.
  ② The base unit replies with ACK\_OK.
  ③ Then handset transmits CHANNEL\_CMD.
- The handset and base unit turn off tx power and scan the channel map for next four channel.
   The handset transmits CHANNEL\_MAP.
- 6 The base unit transmits CHANNEL\_MAP.
- The base and base unit moves to the "vacant channel". (Example: "6").
  The base unit transmits CALL.
  The handset transmits ACK\_OK.

# 13.4. Ports for transmitting and receiving of data

Handset: Base Unit: transmitting (TX) ... 36 Pin transmitting (TX) ... 17 Pin receiving (RX) ... 4 Pin receiving (RX) ... 10 Pin

# 13.5. Waveform of DATA used for cordless transmission and reception

The DATA which is transmitted from the Handset to the Base Unit is combination of DATA 0, DATA 1, PSEUD. The DATA which is transmitted from the Base Unit to the Handset is combination of DATA 0, DATA 1, PSEUD.

### 13.5.1. Handset

# Transmitting DATA Element Format

## 13.5.2. Base Unit

For example (one of part of data)

# 14 BLOCK DIAGRAM (BASE UNIT)

CO CD

KX-TC1205RUB/W/S/F BLOCK DIAGRAM (BASE UNIT)

# 15 BLOCK DIAGRAM (HANDSET)

СО

# **16 CIRCUIT OPERATION**

# 16.1. Outline

Base unit consists of the following ICs as shown in BLOCK DIAGRAM.

- CPU:IC2
  - Controlling the whole system
  - Forming/analyzing all data signals (ACK, CMD signal etc.\*)
  - All interfaces (ex: LED, KEY, SP, Mic, LCD, Detector Circuit (Charge/ Power Down)
  - \*Refer to EXPLANATION OF CPU DATA COMMUNICATION (P.32).
- RF IC:IC1
  - PLL Oscillator
  - Detection
  - Compress/ Expander
  - first/ second mixer
  - Amplifier for transmission and reception
- · Additionally,
  - Power Supply Circuit
  - Reset Circuit
  - Charge Circuit
  - Telephone Line Interface Circuit

Handset consist of the following ICs as shown in BLOCK DIAGRAM.

- CPU: IC2
  - All data signals (forming/analyzing ACK or CMD signal\*)
  - All interfaces (ex; LED, Key, Buzzer, Detector Circuit, Charge, Battery Low)
  - RAM for keeping the data (CH Number, ID Code, etc.)
- RF IC:IC1
  - PLL Oscillator
  - Detector
  - Compress/Expander
  - first, second mixer
  - Amplifier for transmission and reception
  - \*Refer to EXPLANATION OF CPU DATA COMMUNICATION (P.32).

# 16.2. Power Supply Circuit

The power supply to the CPU (Digital, Analog) and RF IC from AC Adaptor (+12V) is shown in the diagram below.

The base unit power supply is DC12V. The handset's power is supplied from 3.6V battery (Nickel-Cadmium battery) which is installed in the handset

Power supply for transmitter is turned on by a press of "Talk" key on the handset. During the stand-by mode, the unit stops transmitting but receive thhe signal.

Also during on-hook condition (the handset is placed on the base unit), backup power for memory of the last dialed number is supplied through the battery (3.6V nickel-cadmium in the handset). The memory of this unit is not backed up by the curreent from the telephone line.

The base unit DC power supply is regulated by Q18, the CPU power is regulated by Q19. The Q8, detects AC Adaptor powerfailure and maintains the unit cecutiry cord;

# 16.3. Reset Circuit (Base Unit)

After power supply from AC adaptor, the VREG is input for making reset signal. Refer to the below waveform.

## 16.4. Charge Circuit

#### Circuit Operation:

When charging the handset on the base unit, the charge current is as follows;

DC (JK2) ® L8 ® D6 ® L7 ® CHG+(Base) ® [CHG+(Handset) ® L4 ® Q9 ® BATT(1 )....Battery....BATT(2) ® L5 ® CHG-(Handset)] ® CHG+(Base) ® L5,

In this way, the CPU on both unit detects the fact that the battery is charged.

The charge current is controlled by switching Q701 of Handset. The battery is charged in normal mode for 10 hours and then in trickle mode.

## 16.5. Telephone Line Interface

#### Function:

- Bell signal detection
- · ON/OFF hook and pulse dial circuit
- · Side tone circuit

#### Bell signal detection and OFF HOOK circuit:

In the idle mode, Q103 is open to cut the DC loop current and decrease the ring load. When ring voltage appears at the Tip (T) and Ring (R) leads (when the telephone rings), the AC ring volltage is transferred as follows.

JK1 (3): T ® L6 ® R144 ® IC3D (12,13 ® 14) ® C97 ® R148 ® Q20 ® IC2 (24) [BELL]

JK1 (2): R ® L4 ® R120 ® R152 ® t

When the CPU (DSP) detects a ring signal and press the TALK Key on the handset. Q6 turns on and then RY1 turns on, thus providing an off-hook condition (active DC current flow through the circuit) and the following singal flow is for the loop current.

T ® R160 ® L4 ® RY1 ® R107 ® T7 ® R116 ® D5 ® L6 ® R161 ® R [OFF HOOK]

#### **ON HOOK Circuit:**

Q6 is open, RY1 disconnected as to cut the DC loop current and to cut the voice signal. The unit is consequently in an on-hook condition.

## Pulse Dial Circuit:

DSP (Relay) turns RY1 ON/OFF to make the pulse dialing via Q6.

Make/Break ratio when dialing with the Handset: 40%:60%

## Side Tone Circuit:

Basically this circuit prevents the TX signal from feeding back to RX signal.

As for this unit, TX signal feed back from Q11 is canceled by the cancellor circuit of AGC.

#### 16.6. Transmitter/Receiver

Base Unit and Handset are mainly consists of RF(Radio Frequency) IC and CPU.

Base Unit and Handset transmit/receive voice signal and data signal through the antenna on carrier frequency.

#### Signal Pass:

\*Refer to CDL TX/RX in Signal Route (P.44).

#### 16.6.1. Base to Handset

#### **Circuit Operation:**

The voice signal input from the TEL LINE interface goes to RF IC as shown in

#### BLOCK DIAGRAM (BASE UNIT) (P.36).

In the talk mode (off-hook) condition, the telephone line voice signal passes through D2, D3, D4, D5, RY1 (Relay), R107 and T7.

The other party's voice signal is coupled with T7 and amplified by Q11 and led to IC3-B (OP Amplifier device).

And the signal goes through the compressor of RF IC, it is output to transmitter circuit.

The signal of the data sent to the handset is applied in the anode of the variable capacitor diode (VARICAP: DV1).

The capacitor of VARICAP is changing in accordance with the voice signal from telephone line interface or TX DATA signal from CPU.

Therefore, the carrier frequency which is generated by TXVCO will be changing, and Frequency modulated RF signal is generated and amplified by RF AMP(Q3, Q4, T5).

It pass through the Duplexer DPX1 and radiated from Antenna.

The signal is transmitted from the base unit and received by the handset antenna and amplified by RF amplifier (Q1) through DPX1 as shown in **BLOCK DIAGRAM (HANDSET)** (P.37). And then it is converted to 10.7 MHz and 450 KHz Intermediate frequency by RF IC and related components.

The demodulated audio signal is output from RF IC (DET OUT) and passed through "Expander" process to reduce noise, then voice signal amplified by "Receiver amplifier" is output to receiver (REC1).

The receiver loudness is adjustable using "LOUD" key on the handset. Q2 and Q3 control the volume. When CPU (VOL1) becomes low, the volume becomes "MID", while CPU (VOL 1,2) becomes low, the volume becomes "HIGH".

## TX data (to Handset)

CPU (VTX) becomes low to turn on the transmission power transistor Q2, and CPU (TX-data) sends data signal. It is FM-modulated by TXVCO and driven by RF AMP, then transmitted to the handset.

### 16.6.2. Handset to Base

#### Circuit Operation:

The voice signal from the handset user is picked up by the microphone (MC1), voice signal passes through "Compressor" process to reduce noise as shown in **BLOCK DIAGRAM (HANDSET)** (P.37). And the voice is FM-modulated by VARICAP (DV1).

The carrier frequency is generated by TX VCO. The transmitter power transistor Q4 is turned on/off by CPU (VTX).

The carrier signal is amplified by RF AMP and sent to the handset duplexer and antenna.

The signal of 49MHz band (49.670~49.99MHz) which is input from ANT is filtered at DPX1 as shown in

BLOCK DIAGRAM (BASE UNIT) (P.36), then it is input to RF IC.

The signal input to RF IC is converted through Mixer inside of RF IC, RF filter (CF1, CF2) and Expander.

The signal is transmitted from the handset and received by the base unit antenna and amplified by RF amplifier Q1, then it is converted to 10.7 MHz and 450 KHz Intermediate by RF IC. The demodulated audio signal is output from RF IC (DET OUT) and passed through "Expander" process to reduce noise, then voice signal is led to LINE AMP.

The signal is passed through TELEPHONE INTERFACE and Tel-line.

#### RX data (from Handset):

The data signal from handset (ex: Talk, ACK, COM) is also included in 49 MHz band same as the voice data. After second if filter, the data signal is made square shape by data limiting AMP of the RF IC. RX data is output to CPU (RX Data).

### 16.6.3. RF signal operation/control and PLL operation (RF UNIT)

Base unit radio frequency signal received by antenna passes through duplexer (DPX1). RF signal is amplified by RF AMP. RF signal received from RF IC is mixed with RX local frequency at Mixer to generate 10.7 MHz wide band IF. The reference frequency is generated by X1 11.15 MHz crystal.

VC1 is the reference frequency for adjustment. The 10.7 MHz is mixed with reference and 450KHz narrow band IF is generated. The demodulation audio signal is adjusted to the maximum at T1.

RF IC is controlled by CPU (RF\_STB, DATA, CLK). The RX local frequency is generated by RXVCO.

## 16.7. Signal Route

Each signal route is as follows.

```
IN <sup>8,9</sup>|»I
SIGNAL ROUTE
                                                                  ROUTE

# 17 CIRCUIT OPERATION (HANDSET)

# 17.1. Reset Circuit (Handset)

The power of handset is supplied by battery.

Whenever the battery is recharged or inserted, the impulse at CHG+ becomes Reset signal through Q11, and sent to CPU.

# 17.2. Battery Low / Power Down Detector

## Circuit Operation:

"Battery Low" and "Power Down" are detected by RF IC which check the voltage from battery. Shortly, every detected blocks are inside of RF IC. The detected voltage is as follows;

• Battery Low

Battery voltage: V(Batt) < 3.57V

The CPU detects this level and "Recharge battery" LED starts flashing.

• Power Down

Battery voltage : V(Batt) < 3.3V

The output of RF IC (P-DOWN) becomes low level, then CPU stops working to keep the data (CH number, ID Code, etc.)

# 20 HOW TO REPLACE FLAT PACKAGE IC

## 20.1. Preparation

• SOLDER

Sparkle Solder 115A-1, 115B-1 or Almit Solder KR-19, KR-19RMA

Soldering iron

Recommended power consumption will be between 30 W to 40 W.

Temperature of Copper Rod 662  $\pm$  50°F (350  $\pm$  10°C) (An expert may handle between 60 W to 80 W iron, but beginner might damage foil by overheating.)

• Flux

HI115 Specific gravity 0.863.

(Original flux will be replaced daily.)

# 20.2. Procedure

1. Temporary fix FLAT PACKAGE IC by soldering on two marked 2 pins.

\*Most important matter is accurate setting of IC to the corresponding soldering foil.

2. Apply flux for all pins of FLAT PACKAGE IC.

3. Solder employing specified solder to direction of arrow, as sliding the soldering iron.

# 20.3. Modification Procedure of Bridge

- 1. Re-solder slightly on bridged portion.
- 2. Remove remained solder along pins employing soldering iron as shown in below figure.

# 24 REPLACEMENT PARTS LIST

#### Note:

#### 1. RTL (Retention Time Limited)

The marking (RTL) indicates that the Retention Time is limited for this item.

After the discontinuation of this assembly in production, the item will continue to be available for a specific period of time. The retention period of availability depends on the type of assembly and the laws governing parts and product retention

At the end of this period, the assembly will no longer be available.

### 2. Important safety notice

Components identified by the A mark indicates special characteristics important for safety. When replacing any of these components, only use specified manufacture's parts.

3. The S mark means the part is one of some identical parts. For that reason, it may be different from the installed part.

#### 4. RESISTORS & CAPACITORS

Unless otherwise specified;

All resistors are in ohms (W) K=1000Q, M=1000kQ

All capacitors are in MICRO FARADS (| $\mathbf{J}$ F) P=|j|jF

# 25 FOR SCHEMATIC DIAGRAM

# 25.1. Base Unit (SCHEMATIC DIAGRAM (Base Unit))

- 1. DC voltage measurements are taken with an oscilloscope or a tester with a ground.
- 2. The schematic diagrams and circuit board may be modified at any time with the development of new technology.

#### Important Safety Notice:

Components identified by A mark have special characteristics important for safety. When replacing any of these components, use only the manufacturer's specified parts.

# 25.2. Handset (SCHEMATIC DIAGRAM (Handset))

- 1. DC voltage measurements are taken with an oscilloscope or a tester with a ground.
- 2. The schematic diagrams and circuit board may be modified at any time with the development of new technology.
